

Start `extract_turn`

```
graph TD; Start([Start extract_turn]) --> Check[Check Document Text Existence (_require_document)]; Check --> Iterate[Iterate through Focus Areas (NAME_FIELDS)]; Iterate --> Build[Build User Prompt via build_user_prompt]; Build --> Parse[OpenAI Chat Completion responses.parse (Structured)]; Parse --> Merge[Deep Merge with Prev (merge_results)]; Merge --> Record[Record Turn Snapshot & Save Artifacts]; Record --> End([End]);
```

The flowchart illustrates the `extract_turn` process. It begins with a yellow oval labeled 'Start `extract_turn`'. This leads to a series of seven light blue rectangular process blocks, each with a black border and a drop shadow, connected by downward-pointing arrows. The steps are: 'Check Document Text Existence (`_require_document`)', 'Iterate through Focus Areas (`NAME_FIELDS`)', 'Build User Prompt via `build_user_prompt`', 'OpenAI Chat Completion `responses.parse` (Structured)', 'Deep Merge with Prev (`merge_results`)', and 'Record Turn Snapshot & Save Artifacts'. The process concludes with a yellow oval labeled 'End'.

Check Document Text
Existence (`_require_document`)

Iterate through
Focus Areas (`NAME_FIELDS`)

Build User Prompt
via `build_user_prompt`

OpenAI Chat Completion
`responses.parse` (Structured)

Deep Merge with Prev
(`merge_results`)

Record Turn Snapshot
& Save Artifacts

End

Refinement Type:
Holistic revision

Start verification

```
graph TD; Start([Start verification]) --> Clear[Clear previous unused_patch_set (if requested)]; Clear --> Build[Build Prompt with previous_extraction]; Build --> LLM[LLM generates PatchSet (Minimal corrections)]; LLM --> Parse[Parse Patch list & Deduplicate]; Parse --> Append[Append to unused_patch_set]; Append --> End([End]);
```

The flowchart illustrates a verification process. It begins with an oval node labeled 'Start verification'. An arrow points down to a rectangular process node 'Clear previous unused_patch_set (if requested)'. This is followed by another arrow to a rectangular process node 'Build Prompt with previous_extraction'. The next step is a rectangular process node 'LLM generates PatchSet (Minimal corrections)'. This leads to a rectangular process node 'Parse Patch list & Deduplicate'. The final process step is a rectangular process node 'Append to unused_patch_set'. An arrow from this node points down to an oval node labeled 'End'.

Clear previous unused_patch_set
(if requested)

Build Prompt with
previous_extraction

LLM generates PatchSet
(Minimal corrections)

Parse Patch list
& Deduplicate

Append to
unused_patch_set

End
